# WIREFRAME – PROJECT 2: CREATE A FULL STACK APP

## User Group
Senior Citizens who have to see multiple doctors.

## Goal

1. Go for medical appointments on time.
2. Keep track of changes to medical appointments.

## Problem Statement
1. Multiple sources of appointments including cards and phone reminders, making it difficult to keep track of the appointments and changes.

2. Conventional calendar apps have fonts that are too small for senior citizens' to read and buttons that are too small to click/press.

## Solution

Unified Appointment Tracker

In a single app, seniors can view all their appointments and easily  make edits to the appointments.

## User stories

1. My mum has 7 specialist doctors and each of them

gives her a medical appointment card to record her next appointment.

2.  As appointment cards become more rare, an alternate source of appointment confirmation and reminders emerged – SMS reminders. This adds to the complexity for senior citizens to manage changes to the appointments.

3. My aunt doesn't have a filing system and she sometimes misplaces her appointment cards and spends hours looking for them.

4. My mum to use the magnifying glass to read her appointment card from each doctor because the font is too small and too cluttered for a piece of card no bigger than a phone.
